

got way too far ...

player controls

< > Keys

maybe up/down

NO??

What??

include Mini scoreboard

The Count!! is: —

have a bunch of
spectators (fun? (probably))
(more than that)

The Time is: —

timer
on
screen?
(too
busy?)

Player
drops
ball
with
(space)
Come
at a
time)

Balls Flying across the
screen at dif speeds (random
spots)

Pixel Paper - 800 x 600
Graph Paper for Screen Coordinates

Window edge
→ (made it reappear on other side (Yay (easy)))
got WAY too fast w gravity increasing
but wanted to keep grav so made
grav reverse ☹️ (me) (smart)

→ how to make projectile spawn in
player square X pos.
↓
○

(> Vector2 playerPos = new Vector2
(playerMove.x, 0);
seperated player & proj into sep classes & it
stopped working.)

(didn't work in player.cs)

can't bring this Vector2 into projectile.cs coz
I can't make it public... It's in a void. Can't put it in
class free form coz it references another Vector2 there (P)

put it in game.cs and it worked
after figuring out class stuff!!

had to include
this (doh!)

↑ (this was
a gony)
JoePlayer.playerMove.x

how to draw classes into game, CS ^{PP}

4 classes {
Player
Projectiles
enemy Ball
~~gravity~~
spectators

Class FunClass = new Class();

FunClass.Variable

← calling
variables

← stupid

Made a class array of balls and collision stopped.

Has something to do with evilPos becoming randomized
in an array. (The random positions / array worked tho!)

set dir x pos →

so player can
hit them.

0 →

0 →

Something is rotten & Mult enemies doesn't work
Need to research this later

☹ ☹ ← Made spectators spawn in a class array
to have something

Something broke when ^{separating} ~~making~~ player and projectile
code. The Proj is extremely fast.

↑ lowered gravity.y by 8?
(unsure why this happened
but it's OK)
